Energy from 4 Types of Protein
Easily Absorbed
0% Cholesterol
Low Calorie

Instruction : Take 1-2 packs per consumption. Tear the package and pour in 150 millimeters of water. Nutrinal Shaking Glass should be used for better dissolution and taste.

PROPERTIES OF INGREDIENTS

Wheatgrass Powder

Wheatgrass powder yields protein up to 70% and it is also the digestible protein with high content of chlorophyll helping to balance body system and stimulate metabolism. Consequently, your body will be able to build muscular mass and control weight. It also contains saponin helping to complete functions of muscle building process. Moreover, it also helps to nourish lymph and immune system.

Chlorella Protein

Chlorella Protein yields protein up to 60% and it is the protein obtained from unicellular plants yielding some essential amino acids that are compared as protein yielded from meat. It is a kind of small protein accelerating absorption of intestine for rapid absorption that is more rapid than protein obtained from meat by 4 times. It is appropriate for any person wishing to build muscle because it is not necessary for body to wait for digesting protein to be small molecules therefore it can be absorbed for functioning more rapidly.

Soy Protein Isolate

Soy is a kind of plant providing absolute protein containing up to 90% of protein and it also contains almost all types of essential amino acids. It is processed for extracting carbohydrate and Antinutritional Factor helping to increase protein content while reducing fat. It is also able to be absorbed easier than protein obtained from meat by 2.5 times.

Rice Protein

It contains complete essential amino acids that can be digested and absorbed to body rapidly. In addition, it also contains Branch Chain Amino Acid (BCAA) helping to increase muscle mass while repairing degenerated cells and generating tissues. It also helps to generate and repair DNA in restoring torn muscle caused by exercising while helping to reinforce immune system.

(BCAA) Branched - Chain Amino Acid

There are 3 types of essential amino acids consisted of :

1. Leucine
2. Isoleucine
3. Valine

It helps to stimulate Growth Hormone release helping to stimulate protein generation and increase muscular mass. It also helps to reduce protein catabolism while exercising making muscle to be stronger and more durable.

Creatine Monohydrate

It is a kind of nutrient that can be generated by our body in limited amount via 2 types of amino acid including Arginine and Glycine. It is beneficial for anyone wishing to build muscle and it also helps to strengthen muscle.

Kiwi Powder

It helps to digest protein while improving the efficiency of protein absorption.

Partially Hydrolysed Guar Gum

It is a kind of natural fiber extracted from Guar Plant seeds helping to balance excretory system and control fat and blood sugar level.

Magnesium It helps to control the function of muscular system that is related to metabolism.

Niacinamide It helps to nourish skin and restore body from exhaustion.

Iron Amino Acid Chelate

It helps to enhance body growth and prevent exhaustion.

Riboflavin (Vitamin B2) It helps to nourish skin, hair, and nails while improving efficiency of vision and relieving exhaustion of eyesight.

Thiamin Mononitrate (Vitamin B1) It helps to reinforce carbohydrate metabolism as energy affecting to the functions of nervous system, heart, and gastrointestinal tract.

Chromium Picolinate It helps to carry protein to body parts while helping to prevent acute fatigue.

Vitamin D It helps to improve calcium and phosphorus that is necessary for the strength of bones and teeth.

Biotin It helps to burn fat and protein as well as relieves exhaustion and pain of muscle.

Folic Acid It helps to reinforce erythropoiesis, control the functions of brain cells and emotion to be in normal condition as well as helps to burn RNA and DNA that are the important factors for synthesizing protein used in generating blood and cells.

Phylloquinone (Vitamin K) It helps to improve secondary hemostasis and prevent Osteopenia.
